***Anti-depressants: the next generation?***

# Selective Serotonin Reuptake Inhibitors and Affective disorders

- Neurobiology of the serotonin system
- Changes in serotonin system in depression
- Past and present antidepressant treatments
- Selective serotonin reuptake inhibition (SSRI), 5-HTT/SERT blockers
- Possible mechanism of action of SSRIs:
  - Increased serotonin in synapse
  - Decreased post-synaptic 5-HT<sub>2A</sub> receptor signalling
  - Increased pre-synaptic or post-synaptic 5-HT<sub>1A</sub> receptor signalling
- Assessing SSRI mechanism of action in animal models
- 5-HTT gene polymorphism as a risk factor for depression: the s allele paradox
- Efficacy of SSRIs as depression pharmacotherapy

# Neurobiology of the Serotonin (5-HT) system

## Cell bodies & Projections in Human brain

RRN = Rostral raphe nuclei = Dorsal RN (B7) + Medial RN (B8)

A: Amygdala, PFC: Prefrontal cortex, ST: Striatum, Th: Thalamus, TL: Temporal lobe,

## Cell bodies & Projections in Rat brain

B7-B9 = Rostral groups of neurons

B7 = Dorsal raphe nucleus

B8 = Medial raphe nucleus

B9 = Pontine tegmentum

DS: dorsal Striatum, VS: ventral Striatum, PFC: Prefrontal cortex

# Serotonin Neurons and Synapses: Pre-synaptic

# Serotonin Neurons and Synapses: Post-synaptic

**13 5-HT Receptors, 12 G protein-coupled receptors and 1 (5-HT<sub>3</sub>) ionotropic receptor**

5-HT <sub>1A</sub>	Hippocampus, Amygdala, Anterior cingulate cortex
5-HT <sub>1B</sub>	Nucleus accumbens, Dorsal Striatum, Substantia nigra
5-HT <sub>2A</sub>	Anterior cingulate cortex
5-HT <sub>2C</sub>	Ventral tegmental area, Nucleus accumbens, Dorsal Striatum, Substantia nigra
5-HT <sub>3</sub>	Hippocampus, Brain stem, Spinal cord
5-HT <sub>4</sub>	Nucleus accumbens, Dorsal Striatum, Hippocampus
5-HT <sub>5B</sub>	Habenula, Hippocampus
5-HT <sub>6</sub>	Nucleus accumbens, Dorsal striatum, Hippocampus, Anterior cingulate cortex
5-HT <sub>7</sub>	Hypothalamus, Thalamus, Suprachiasmatic nucleus, Anterior cingulate cortex

# BOLD fMRI-based model of processing of negative stimuli in depression

# Overview of brain regions involved in depression and their monoaminergic connections

+: Excitatory; -: Inhibitory.

BLA: Basolateral amygdala; BNST: Bed nucleus of stria terminalis; CeA: Central amygdala; DR: Dorsal raphe nucleus; dGP: Dorsal globus pallidus; LC: Locus coeruleus; MR: Median raphe nucleus; NAcs: Nucleus accumbens shell; NAcc: Nucleus accumbens core; dStriatum: Dorsal striatum; PFC: Prefrontal cortex; PVN: Paraventricular nucleus of hypothalamus; SN: Substantia nigra; VTA: Ventral tegmental area; vGP: Ventral globus pallidus.

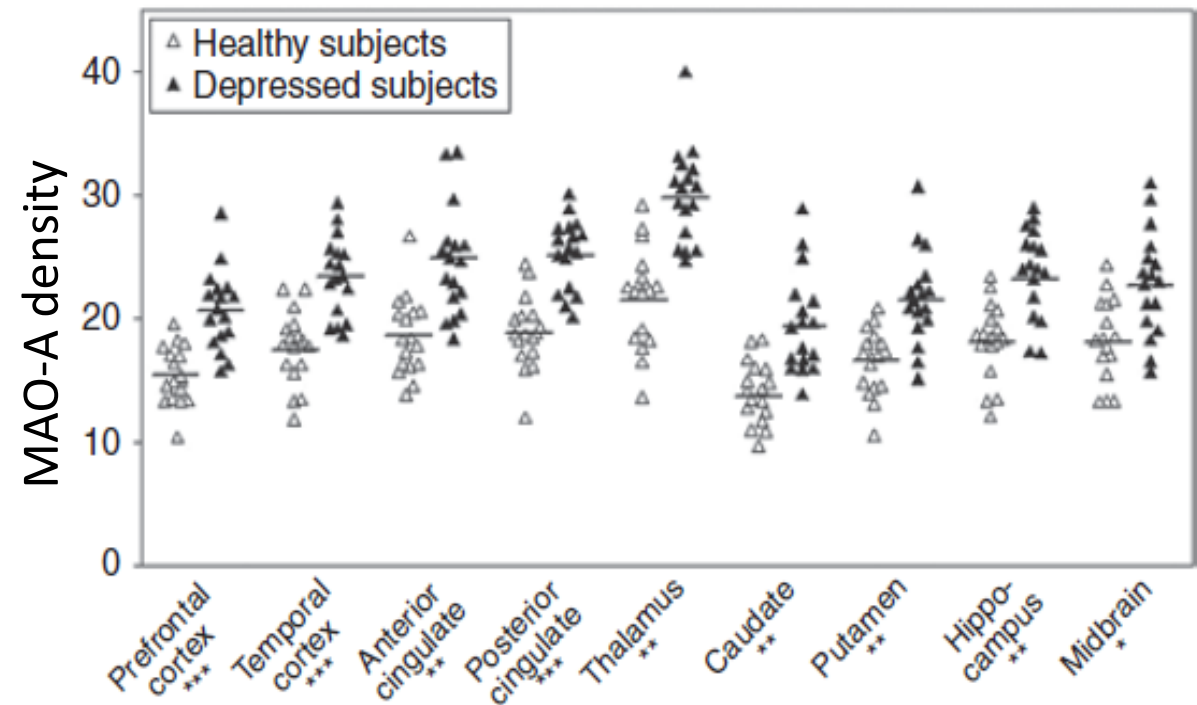

## Evidence for changes in Serotonin system in (some) depression studies

---

- High monoamine oxidase-A (MAO-A) density throughout brain
  - High serotonin transporter (5-HTT) density in cortico-limbic regions in some patients
  - Low 5-hydroxyindoleacetic acid (5-HIAA) levels in cerebrospinal fluid
  - Low tryptophan levels in plasma (link to cytokine-kynurenine pathway)
  - Tryptophan depletion may lead to relapse in recovered patients
- 
- Decreased numbers of 5-HT<sub>1A</sub> receptors both pre- and post-synaptically
  - Either increased or decreased numbers of 5-HT<sub>2A</sub> and 5-HT<sub>2C</sub> receptors post-synaptically
  - Dysregulation in post-transcriptional (mRNA) 5-HT<sub>2C</sub> receptor editing
-

# Pre-synaptic neuron (and glia) monoamine oxidase-A density is increased in depression

- MAO-A and MAO-B
- Catalyses the oxidation of monoamine (5-HT, DA, NE)
- Bound to outer membrane of mitochondria

# **Serotonin transporter density is increased in depression-relevant regions** **- especially in patients with High Dysfunctional Attitude Scale scores (pessimism, hopelessness)**

# Inflammation Hypothesis: Kynurenine Pathway inhibits Serotonin and Dopamine neurotransmission

# Possible mechanisms of action of SSRIs: Increased Serotonin in the synapse

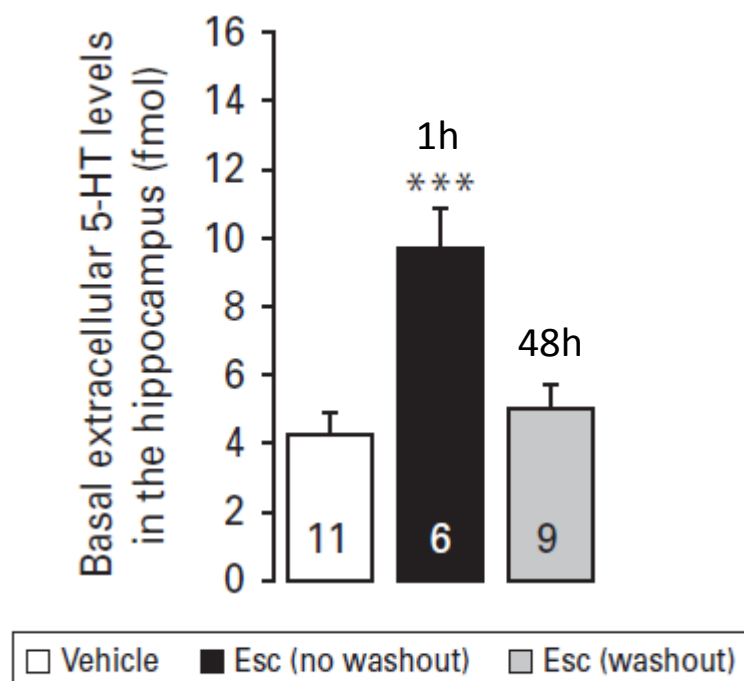

## Pharmacotherapeutic strategy of blocking serotonin reuptake

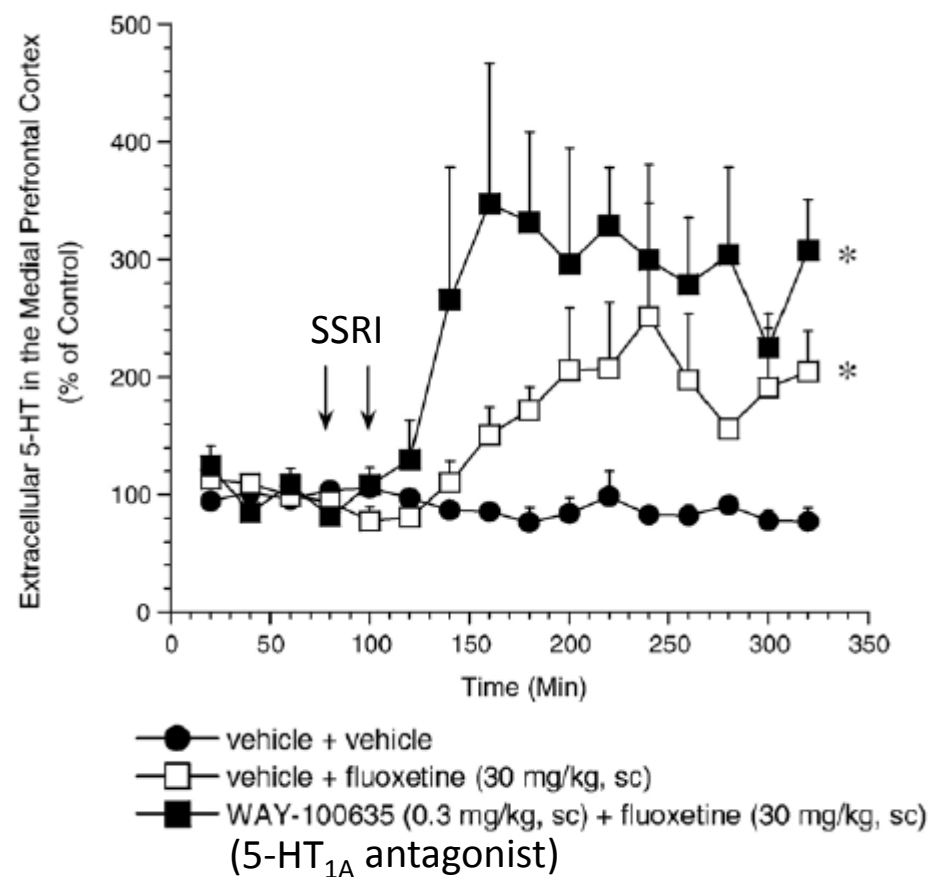

## Acute SSRI leads to increased serotonin release in the rodent brain

### Acute escitalopram effects on 5-HT in mouse hippocampus

### Acute fluoxetine effects on 5-HT in rat medial prefrontal cortex

# Changes in serotonin signalling in Stress and Depression:

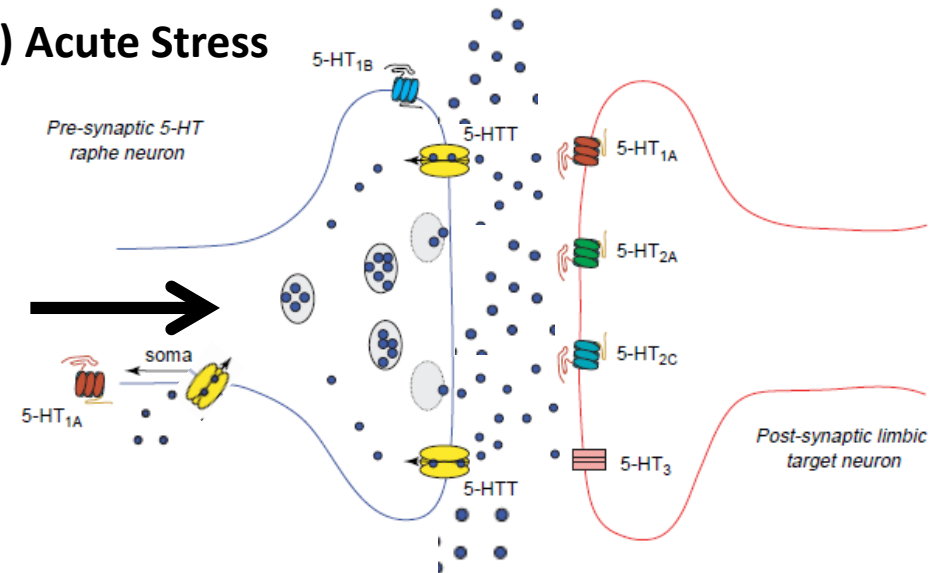

## Serotonin levels, 5-HTT levels, and pre- and post-synaptic 5-HT receptor function

### (1) Homeostasis

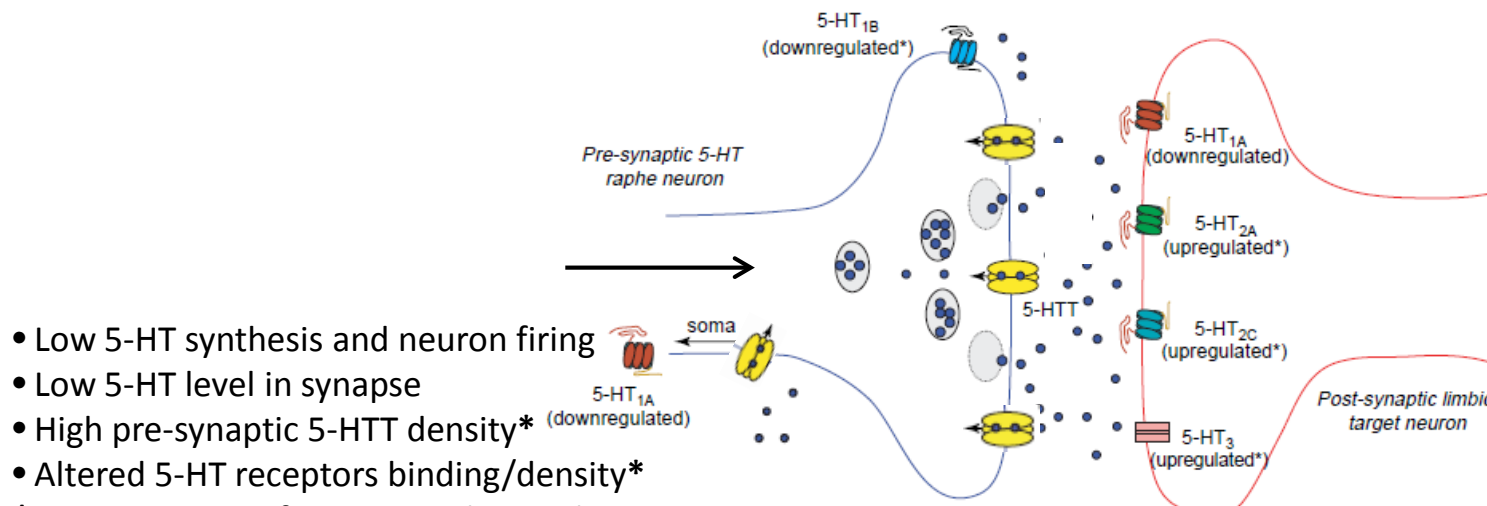

- Moderate 5-HT synthesis and neuron firing
- Moderate 5-HT level in synapse
- Moderate pre-synaptic 5-HTT density
- Post-synaptic 5-HT receptors normal

### (2) Acute Stress

- High 5-HT neuron firing
- High 5-HT level in synapse
- Moderate pre-synaptic 5-HTT density
- Post-synaptic 5-HT receptors normal

### (3) Depression/Chronic Stress

- Low 5-HT synthesis and neuron firing
- Low 5-HT level in synapse
- High pre-synaptic 5-HTT density\*
- Altered 5-HT receptors binding/density\*

\* To compensate for increased 5-HT during acute stress

But, Conditions for:

- Increasing 5-HTT density
- Modifying post-synaptic 5-HT receptors binding/density

# Applying the scientific approach to antidepressants discovered using the chance approach

# Current generation anti-depressant action: 5-HTT (SERT) blocker / reuptake inhibition

## (3) Depression/Chronic Stress

## SSRI Efficacy: meta-analysis

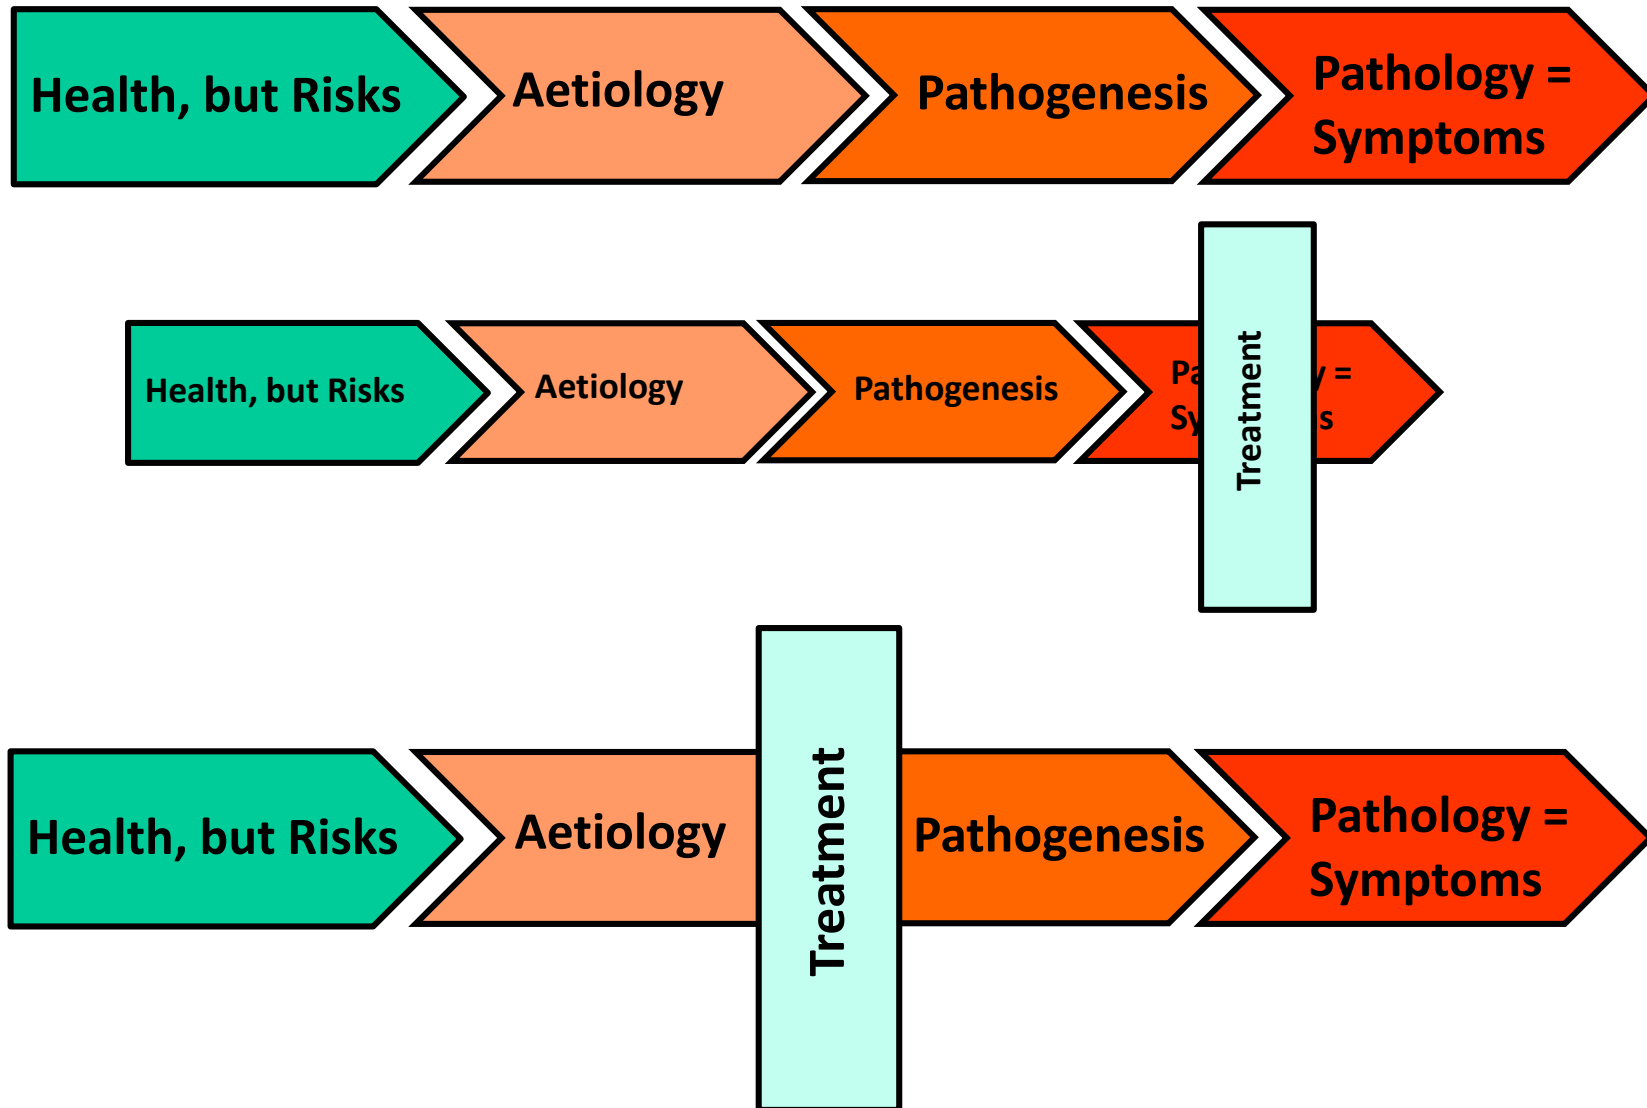

Despite SSRI's:

- Depression remains highly prevalent
- Patient non-response is high
- Onset of response is delayed
- Relapse is common
- Recurrence is common
- Hospitalisation and invasive treatments are common (e.g. ECT, experimental pharmacology)

# The Aetiology-Pathogenesis Interface as the key to understanding depression:

Understanding the mechanism underlying a disease is essential to its treatment

## Selective Serotonin Reuptake Inhibitors and Affective disorders

- Serotonin neuron cell bodies located in Raphe nuclei and project to structures important in emotional and cognitive processing
- 5-HT<sub>1A</sub> receptor, VMAT, 5-HTT and MAO are important pre-synaptic regulators of 5-HT neurotransmission
- Thirteen 5-HT receptors are important post-synaptic mediators of 5-HT neurotransmission. 5-HT<sub>1A</sub>, 5-HT<sub>2A</sub>, 5-HT<sub>2C</sub> are proposed to be particularly important in stress/depression
- Serotonin projects to several structures that exhibit altered activity in depression, including Anterior cingulate cortex, Amygdala, Hippocampus, Nucleus accumbens
- Evidence that several factors that regulate or mediate serotonin neurotransmission are altered in depression
- Chance findings that drugs that inhibit serotonin catabolism or reuptake are anti-depressant have led to SSRIs as the current generation of anti-depressant drugs
- The scientific approach of targeting the aetiology-pathophysiology provides only limited support for SSRIs as depression drugs
- SSRIs leading to decreased 5-HT<sub>2A</sub> and/or 2C signalling or increased 5-HT<sub>1A</sub> signalling have been proposed as possible mechanism of action
- There is a paradox that the current treatment of depression is SSRI (5-HTT blocker) but the major risk factor is a polymorphism that leads to decreased 5-HTT expression/function. This polymorphism is a risk factor in interaction with childhood stress
- SSRIs are comparable to placebo in mild depression and somewhat more efficacious than placebo in severe depression
