(Time 90 min)

All 10 questions are equally weighted, i.e. 6 points per question.

Answers may be given in English or German.

You must put your name on EVERY SHEET!

## 1. Multiple Sclerosis (only 1 answer is correct): (6 points)

Which answer is best (2 points):

The etiology of Multiple Sclerosis is most probably due to

- a multiple factors
- b) an autosomal recessive defect
- c) due to a virus infection
- d) due to toxins in the environment
- nutritional reasons

Which answer is best concerning the efficacy of current disease-modifying therapies against Multiple Sclerosis (MS) (2 points):

- a) They are of too low efficacy to justify their usage in young adults.
- Regularly, they completely stop disease activity.
- They are more effective against relapsing-remitting MS than against secondary progressive MS.

A 30 year-old man with known relapsing-remitting Multiple Sclerosis presents with right hemiparesis and bladder dysfunction as symptoms of an acute relapse. How will he probably be treated in the very acute phase? (2 points)

- No specific therapy, but physiotherapy and psychotherapeutic support.
- With steroids. b)
- c) With natalizumab.
- d) With interferons.
- e) With glatirameracetate.

### 2. Neuromuscular Disorders (only 1 answer is correct): (6 points) 1. Neuromuscular Disorder include all but one: (1 point) a) Motoneuronen diseases b) Poly-neuropathy (c) Encephalomyelitis disseminata d) Neuromuscular transmission disorders e) Myopathy 2. Which statement about myotonic dystrophy (DM1) is correct: (2 points) (a)) DM1 is the most common type of muscle dystrophy in children and adults b) DM1 may be associated with a cardiomyopathy and diabetes c) DM1 may be associated with a retinitis pigmentosa and cataracts d) Diagnosis of DM1 requires a muscle biopsy e) all of the above answers 3. Which statement about Pompe's disease (Acid maltase deficiency [acid $\alpha$ -1,4-glucosidase]) is correct: (1

point)

- a) Disease onset is below 18 years
- b) The clinical picture includes a myopathic face
- c) The painless weakness is distally pronounced
- d) Diagnosis of Pompe's disease may be made by enzymatic assays and molecular genetic analysis
- e) Muscle biopsy demonstrates lack of glycogen
- 4. Autoimmune inflammatory polyneuropathies: (2 points)
  - a) Acute Guillain-Barré syndrome (GBS) affects more men than women and can be treated with intravenous immunoglobulins or plasmapheresis
  - (b) Chronic inflammatory demyelinating polyneuropathy (CIDP) may have a chronic progressive or a relapsing remitting course <sup>⋆</sup>
  - c) In contrast to GBS, CIDP may be treated with corticosteroids.
  - d) The presence of multifocal motor neuropathy (MMN) has to be evaluated in the work-up of patients with amyotrophic lateral sclerosis (ALS) with electroneurography and determination of anti-GM1antibodies
- e) all of the above answers

#### 3. Dementia (only 1 answer is correct): (6 points)

- 1. Alzheimer's dementia is characterized: (2 point)
- a) by behavioural problems occurring early in the disease
- b) by the presence of neurofibrillary tangles in the absence of cerebral amyloid-deposition
- rc) by a biomarker profile of low CSF Aβ 42 and mediotemporal atrophy on MRI
  - d) by mild cognitive impairment
  - 2. Which statement is NOT true for dementia with lewy bodies (DLB) (2 points)
  - Lewy bodies consist of  $\alpha$ -synuclein deposits  $^{\downarrow}$ cerebral amyloid deposition is seen in more than half of the cases with a clinical diagnosis of DLB Visual hallucinations in DLB are usual treated with typical neuroleptics that prevent hallucinations by blocking dopamine receptors.
    - Symptoms of parkinson's disease which is also an  $\alpha$ -synucleinopathy can be observed in DLBx REM sleep behavioural disorder can be seen in DLB
  - 3. Which statement is NOT true for frontotemporal lobar degeneration (2 point)
  - a) an imaging finding is atrophy in the anterior temporal lobe  $\,\,\,\,\,\,\,\,\,\,\,$
  - b) an imaging finding is reduced cerebral glucose metabolism in the anterior temporal lobe /
- →c) the underlying pathology can be correctly predicted by clinical assessment in over 80% of the cases
  - d) loss of empathy and sympathy occur early in the context of the behavioural variant
- (e) altered eating habits are a feature of the behavioural variant

4.	Amyotrophic lateral sclerosis (ALS) and Frontotemporal lobar degeneration (FTLD) (only 1 answer is correct): (6 points)
1.	Amyotrophic lateral sclerosis (ALS) and Frontotemporal lobar degeneration (FTLD) are (1 point):
(a) b) c) d) e)	Two different neurodegenerative diseases that overlap clinically, pathologically and genetically Two different names for the same disease Both neurodegenerative diseases that affect motor neurons Both neurodegenerative diseases that affect the frontal cortex Always occurring in the same patients
2.	The major protein component of the ubiquitinated inclusions found in motor neurons of sporadic ALS patients is (1 point):
a)	SOD1
p)	C9ORF72 FUS
(d)	TDP-43
e	Ataxin 2
3.	The most common genetic cause of ALS and FTLD is mutation in (1 point):
a)	SOD1 C9ORF72
9	FUS
d)	TDP-43
e)	Ataxin 2
4.	The neurotoxicity of TDP-43 and FUS is due to the following mechanism (2 points):
a)	Loss of their normal function due to the loss of TDP-43 (or FUS) from the nucleus
b)	Gain of toxicity from abnormal TDP-43 (or FUS) cytoplasmic aggregates  Both a and b are likely contributing to disease
(C)	TDP-43 (or FUS) RNA becomes toxic for neurons
e)	TDP-43 and FUS are not important for ALS pathogenesis
	t and the continuous of ALS include (1 point):
5.	In addition to weakness and muscle wasting, symptoms of ALS include (1 point):
a)	Cramps (www.cla.twitches)
b)	Fasciculations (muscle twitches) Weight loss
d)	Hypersalivation
(e)	All of the above
	C
	O

1) The following protein pathologically accumulates in the brain of Parkinson patients (1 point):  a) TDP-43  b) Armyloid  Alpha-Synuclein d) Tau e) Ubiquitin  2) The following symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):  a) Akinesia b) Rigidity g) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  i) Impulse control disorders b) Constipation c) Umary incontinence d) Dementia e) Anxiety 4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. d)improves most but not all of the motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  2) Clinical examination C) Cerebral MRI C) Crebrospinal fluid analyses  6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability.  d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process. e) Deep brain stimulation is an effective treatment for some motor symptoms of Parkinson's disease		
a) TDP-43 b) Amyloid Alpha-Synuclein d) Tau e) Ubiquitin  2) The following symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):  a) Akinesia b) Rigidity g) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point): b) Constipation (1) Urinary incontinence (2) Urinary incontinence (3) Dementia (4) Anxiety (2) d) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. d)causes irreversible effects. d)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. d)improves most but not all of the non-motor symptoms of Parkinson's disease. 5) The following examination to Cerebral MRI c) Transcranial ultrasound d) Functional imaging (PET, SPECT) e) Cerebrospinal fluid analyses 6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	5. P	arkinson's Disease (only 1 answer is correct): (6 points)
Alpha-Synuclein d) Tau e) Ubiquitin  2) The following symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):  a) Akinesia b) Rigidity (c) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  (a) Impulse control disorders (b) Constipation (c) Urinary incontinence (d) Dementia (e) Anxiety (e) Anxiety (e) Anxiety (f) Constipation (g) Anxiety (g) Anxiety (g) The most promising tool to decelerate underlying neuropathological processes. (g)improves most but not all of the motor symptoms of Parkinson's disease. (g)improves most but not all of the non-motor symptoms of Parkinson's disease. (g)improves most but not all of the non-motor symptoms of Parkinson's disease. (g)improves most but not all of the non-motor symptoms of Parkinson's disease. (g)improves most but not all of the non-motor symptoms of Parkinson's disease. (g)improves most but not all of the non-motor symptoms of Parkinson's disease. (g)improves most but not all of the non-motor symptoms of Parkinson's disease. (g) Clinical examination (g) Clinical e	1) The foll	owing protein pathologically accumulates in the brain of Parkinson patients (1 point):
Alpha-Synuclein d) Tau e) Ubiquitin  2) The following symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):  a) Akinesia b) Rigidity (c) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  b) Constipation c) Urinary incontinence d) Dementia e) Anxiety  4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. d)improves most but not all of the non-motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  C) Tinarcranial ultrasound d) Functional imaging (PET, SPECT) c) Cerebrospinal fluid analyses  6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.		
a) Tau e) Ubiquitin 2) The following symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):  a) Akinesia b) Rigidity c) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point): c) Urinary incontinence d) Dementia e) Anxiety 4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. c)improves most but not all of the non-motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  a) Clinical examination b) Cerebral MRI c) Transcranial ultrasound d) Functional imaging (PET, SPECT) e) Cerebrospinal fluid analyses 6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease is to decelerate the underlying neuropathological process.		
e) Ubiquitin  2) The following symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):  a) Akinesia b) Rigidity (c) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  b) Constipation c) Urinary incontinence d) Dementia e) Anxiety  4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effectsimproves most but not all of the non-motor symptoms of Parkinson's disease. 5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  10) Cerebral MRI c) Transcranial ultrasound d) Functional imaging (PET, SPECT) c) Cerebrospinal fluid analyses 6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.		
a) Akinesia b) Rigidity c) Dystonia d) Tremor e) Postural instability 3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  (a) Impulse control disorders (b) Constipation c) Urinary incontinence d) Dementia e) Anxiety 4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)improves most but not all of the non-motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  (c) Transcranial ultrasound (d) Functional imaging (PET, SPECT) e) Cerebrospinal fluid analyses  6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	,	
a) Akinesia b) Rigidity ① Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  a) Impulse control disorders b) Constipation c) Urinary incontinence d) Dementia e) Anxiety  4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. limproves most but not all of the non-motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  a) Clinical examination c) Transcranial ultrasound d) Functional imaging (PET, SPECT) e) Cerebrospinal fluid analyses  6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	e) U	biquitin
b) Rigidity (c) Dystonia d) Tremor e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  Constipation (1) Constipation (2) Constipation (3) Constipation (4) Dementia (a) Anxiety.  4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. (a)improves most but not all of the motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  (a) Clinical examination (b) Cerebral MRI (c) Transcranial ultrasound (d) Functional imaging (PET, SPECT) (e) Cerebrospinal fluid analyses  6) All of the statements below are true except for the following one: (1 point)  (a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability.  d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	2) The foll	owing symptoms belong to the cardinal symptoms of Parkinson's disease except for (1 point):
(a) Tremor (b) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):  (a) Impulse control disorders (b) Constipation (c) Urinary incontinence (d) Dementia (e) Anxiety (e) (e) Anxiety (f) (f) (e) (e) (e) (e) (e) (e) (e) (e) (e) (e	,	
3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):    Impulse control disorders		
e) Postural instability  3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):    a) Impulse control disorders		
3) Which of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):    Impulse control disorders	d) Ti	remor V
Impulse control disorders  Constipation (Constipation (Constitution (Con	e) P	ostural instability
Constipation (c) Urinary incontinence (d) Dementia (e) Anxiety (d) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. (e)acts via direct stimulation of corticospinal pathways. (e)improves most but not all of the motor symptoms of Parkinson's disease. (e)causes irreversible effects. (e)improves most but not all of the non-motor symptoms of Parkinson's disease. (f) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point) (f) Cerebral MRI (f) Cerebral MRI (f) Cerebral MRI (f) Cerebral HRI (f)	3) Which	of the following non-motor symptoms can be caused by dopaminergic treatment? (1 point):
(a) Constipation (b) Constipation (c) Urinary incontinence (d) Dementia (e) Anxiety (d) Deep brain stimulation in Parkinson's disease(1 point)  (a)is the most promising tool to decelerate underlying neuropathological processes. (b)acts via direct stimulation of corticospinal pathways. (c)improves most but not all of the motor symptoms of Parkinson's disease. (d)causes irreversible effects. (e)improves most but not all of the non-motor symptoms of Parkinson's disease.  (5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point) (e) Cerebral MRI (e) Transcranial ultrasound (f) Functional imaging (PET, SPECT) (e) Cerebrospinal fluid analyses (e) All of the statements below are true except for the following one: (1 point) (e) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. (e) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. (e) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. (f) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	→ May In	npulse control disorders
c) Urinary incontinence d) Dementia e) Anxiety.  4) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathwaysimproves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. improves most but not all of the non-motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  Cerebral MRI c) Transcranial ultrasound f) Functional imaging (PET, SPECT) e) Cerebrospinal fluid analyses  6) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.		
d) Dementia e) Anxiety  A) Deep brain stimulation in Parkinson's disease(1 point)  a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. e)improves most but not all of the non-motor symptoms of Parkinson's disease.  5) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  Cerebral MRI c) Transcranial ultrasound Functional imaging (PET, SPECT) e) Cerebrospinal fluid analyses  E) All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.		
(a) Anxiety:  (b) Deep brain stimulation in Parkinson's disease(1 point)  (c) a)is the most promising tool to decelerate underlying neuropathological processes. (d)acts via direct stimulation of corticospinal pathways. (d)improves most but not all of the motor symptoms of Parkinson's disease. (d)causes irreversible effects. (e)improves most but not all of the non-motor symptoms of Parkinson's disease. (d) The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  (a) Clinical examination (b) Cerebral MRI (c) Transcranial ultrasound (d) Functional imaging (PET, SPECT) (e) Cerebrospinal fluid analyses  (a) All of the statements below are true except for the following one: (1 point)  (a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. (b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. (c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. (d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.		
a)is the most promising tool to decelerate underlying neuropathological processes. b)acts via direct stimulation of corticospinal pathways. c)improves most but not all of the motor symptoms of Parkinson's disease. d)causes irreversible effects. c)improves most but not all of the non-motor symptoms of Parkinson's disease.  The following examination is the most important step in the diagnosis of Parkinson's disease: (1 point)  Clinical examination Cerebral MRI c) Transcranial ultrasound Functional imaging (PET, SPECT) c) Cerebrospinal fluid analyses  All of the statements below are true except for the following one: (1 point)  a) Parkinson's disease is caused by accumulation of alpha-synuclein-positive Lewy bodies in the brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.		
brain. b) Many patients with Parkinson's disease suffer from non-motor symptoms such as depression, dementia or autonomous symptoms. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability. d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	5) The following CI Tr C	acts via direct stimulation of corticospinal pathways. Improves most but not all of the motor symptoms of Parkinson's disease. Icauses irreversible effects. Improves most but not all of the non-motor symptoms of Parkinson's disease. Improves most but not all of the non-motor symptoms of Parkinson's disease. c) The cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural instability.  d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	b) Ma	any patients with Parkinson's disease suffer from non-motor symptoms such as depression,
d) The primary goal of the treatment of Parkinson's disease is to decelerate the underlying neuropathological process.	c) Th	e cardinal symptoms of Parkinson's disease consist of akinesia, rigidity, tremor, and postural
	d) Th	e primary goal of the treatment of Parkinson's disease is to decelerate the underlying

6	Brain	
200	the the	Tumour: (one or several answers may be correct, it is prohibited to cross all
	the ans	swers): (6 points)
1		
10	Inerapy	y of glioblastoma involves (1 point):
	a)	
	755,65	Surgery Radiotherapy
	õ	Chemotherapy 0,33
	- A	All of the above
	1 40	
2.	Which	of the following is true (more than one answer can be correct) (2 points):
	6	Standard therapy of glioblastoma consists of combined radiochemotherapy with
		temozolomide followed by temozolomide alone
	(b)	MGMT is a predictive marker for response to temozolomide
	c)	All patients must be treated in the context of a clinical study
	d)	All of the above is true
		of the following is NOT true: high grade gliomas are characterized by (1 point)
3.	Which	of the following is NOT true. High grade ghornes are
	2)	Mitoses
	b)	Vascular proliferation
	0	Pseudopalisading necrosis
	→d)	Circumscribed growth pattern
	1000000	
4.	Intraop	perative imaging techniques comprise (more than one answer can be correct) (1 point):
	50	Intraoperative ultrasound
	-> b)	Intraoperative MRI
		t the amount of DET
	70	Intraoperative use of 5-aminolevulinic acid fluorescence
_	A natio	ent presents with headache, nausea and morning vomiting for the past days. Which
5.	diagno	stic measure should be performed first (1 point):
	ulagilo	
	a)	MRIX
	b)	EEG∀
	c)	Lumbar puncture
	→d)	Clinical examination
	(e)	PET Scan

7.	Neuropsychology: (one or several answers may be correct, it is prohibited to cross all the answers): (6 points)
1.) Wha	at is NOT true about aphasia? (1point)
a) S (d) V	Sensory aphasia is not the primary cause of apraxia Recovery from aphasia is independent of handedness  One feature of Wernicke aphasia is anosognosia  Writing spared, reading can be severely impaired Amnestic aphasia is a relatively mild form of aphasia
2.) Whi	ich language aspect is typically affected by a lesion between Broca's and Wernicke's area? (1point)
(a) b)	Spontaneous speech
3.) Whi	ich two statements are correct? (more than one answer can be correct) (2 points)
9	Apraxia is a disconnection syndrome Capa (Alumon Selective apraxia for the left hand does not exist Apraxia without aphasia does not exist Apraxia and neglect are mutually exclusive
4.) Wh	at is true about neglect? (1 point)
	Neglect is typically produced by a brain tumor * Neglect implies blindness in one visual field ("hemianopia") Neglect is a retinotopic disorder Neglect is a paradigm disorder to study reference frames in central processing Neglect has a strong genetic component
5.) Wha	at is NOT true about pseudoneglect? (1point)
a)	Pseudoneglect is synonymous to "right-sided spatial inattention"  Pseudoneglect is observed in healthy individuals  Pseudoneglect is amplified by a right parietal lesion

d) Pseudoneglect can affect number space

Pseudoneglect is pronounced in psychotic individuals

# 8. ADHS: (only 1 answer is correct) (6 poinst)

Which of the following statements is **NOT** correct? (6 points)

- b) The taking of stimulants by children and adolescents with a diagnosis of ADHD creates in many cases the prerequisite e.g. concentration, so that certain tasks can be done in a more effective way.
- c) Shaw et al. (2007) could show in his study that children with ADHD have a delayed development of the cortical thickness, compared to healthy Children.
- One of the most common side-effects of the stimulants is the physical and psychological dependence.
  - Different brain structures and functional networks take part in an ADHD, which also reflects the variety of symptoms shown by ADHD concerned people.

# 9. Schizophrenia: (only 1 answer is correct) (6 points) 1. The lifetime prevalence of Schizophrenia in the total population is: (1 point) a) 5-6% b) 2-3% × c) 0.5-1.6%

2. Which statement is wrong? (2 points)

(d) 0,1-0,6% e) 0,01-0,06%

The following diagnostic analysis should be performed obligatory or optional in case of suspect of schizophrenia:

- Genotyping at the time of the disease manifestation
   cerebral imaging techniques (CCT, MRI)
   an internistic/neurogical examination
   d) labor analysis of thyroid parameters
- 3. All listed symptoms are characteristic for schizophrenia beside: (2 ponts)
  - a) hearing your own thoughts
    b) thoughts withdrawal 
    c) Delusions of control
    d) Thought broadcasting
    e) increased excitability of the vegetative system
- 4. Currently it is assumed that following neurotransmitter circuits are involved in schizophrenia beside: (1 point)
  - a) Dysfunction of the GABAergic System
     b) Dysfunction of the serotonergic System
     C) Excessive dopamine activity in the mesocordical System
- d) Excessive dopamine activity in the mesocortical System
   e) Hypo-function of the Glutamate System

10	Neurorehabilitation: (one or several answers may be correct, it is prohibited to cross all the answers): (6 points)
1.	
	a) leads to paralysis exclusively of the lower part of the body and the legs (b) is usually bilateral (c) the full state of functional deficits is seen within minutes after the injury (d) surgical stabilization of the spinal column leads to functional recovery (e) motor and sensory functions are affected
2,	Intense rehabilitative motor training after spinal cord injury or stroke can lead to: (more than one answer can be correct) (2 points)
-	a) long distance nerve fiber regeneration b) enhanced compensatory sprouting of neurites c) stabilization of synaptic connections d) repair of damaged myelin e) all of the above
	Constraint-induced movement therapy: (2 points)
7	a) is motivating b) is available to all patients independent of the degree of impairment c) helps improve function and overcome learned non-use the helps reduce motor impairment b) restrains the impaired limb
	Which of the following statements about robot-assisted rehabilitation is INCORRECT? (1 point
a P 0 0 2	) provides objective readouts about motor and sensory function/impairments ) is as efficient as dose-matched conventional therapy  presults in much better recovery of functions that cannot be improved by conventional therapy allows to optimally engage the patient by adapting difficulty and sistance to his/her level of impairment
